

# Virtual tables for Microsoft Dataverse

Section: Virtual Tables for Microsoft Dataverse

## What's new: Business Central Virtual Tables on Microsoft Dataverse

## Agenda

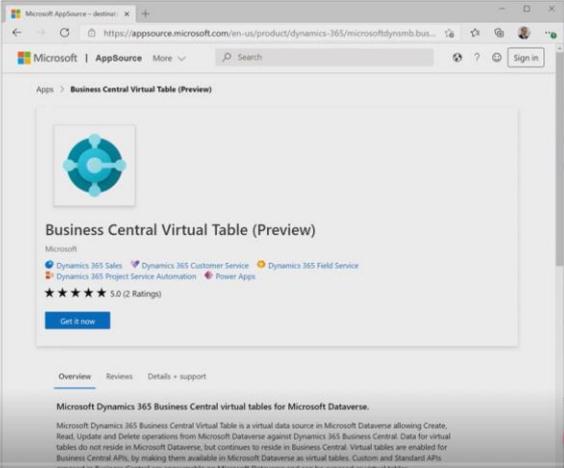

- Introduction to virtual tables
- Enabling and using Dataverse virtual tables for Business Central
- Native and virtual table relations
- Exporting solutions from Dataverse

## Business Central Virtual tables

- Business Central Virtual tables is a virtual data provider on Dataverse
- Supports create, read, update and delete on Business Central tables
- No data will be synchronized to Microsoft Dataverse
- Business Central API metadata and entityDefinition API are used to generate virtual tables
- Custom APIs can be used for virtual tables, enabling partners to create specialized virtual tables

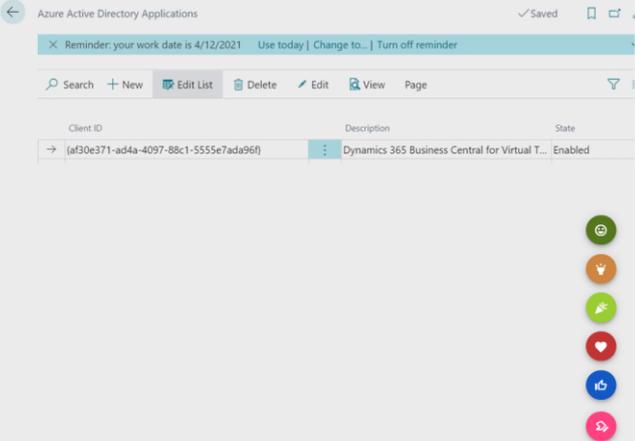

## Setting up connection to Business Central

- Install Business Central Virtual table preview from Appsource
- First grant access to Dataverse on "Azure Active Directory Applications" page in Business Central
- Setup connection on Dataverse
  - "Business Central Virtual Data Source Configuration" table
  - or "Virtual Table Data Sources" settings
- Choose environment and save
- Once saved, Business Central synchronizes companies. Choose a company

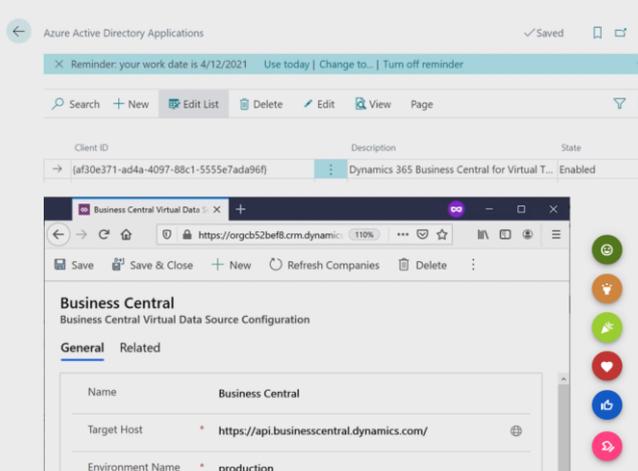

## Setting up connection to Business Central

- Install Business Central Virtual table preview from Appsource
- First grant access to Dataverse on "Azure Active Directory Applications" page in Business Central
- Setup connection on Dataverse
  - "Business Central Virtual Data Source Configuration" table
  - or "Virtual Table Data Sources" settings
- Choose environment and save
- Once saved, Business Central synchronizes companies. Choose a company

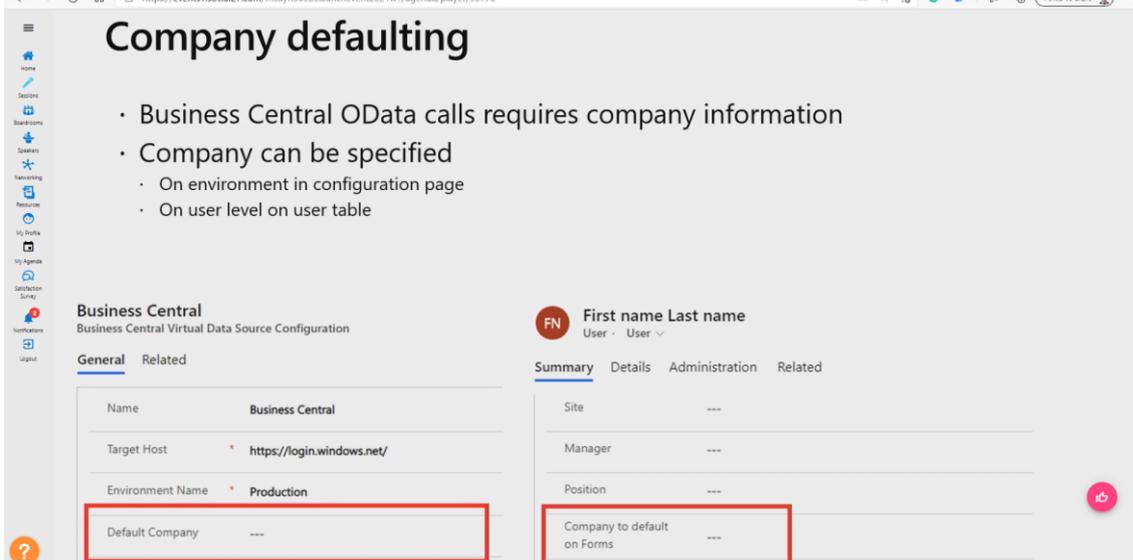

## Setting up connection to Business Central

- Install Business Central Virtual table preview from Appsource
- First grant access to Dataverse on "Azure Active Directory Applications" page in Business Central
- Setup connection on Dataverse
  - "Business Central Virtual Data Source Configuration" table
  - or "Virtual Table Data Sources" settings
- Choose environment and save
- Once saved, Business Central synchronizes companies. Choose a company

## Company defaulting

- Business Central OData calls requires company information
- Company can be specified
  - On environment in configuration page
  - On user level on user table

# Generating virtual tables

- Virtual tables are dynamically generated
- Generation is done through "Available Business Central Table" table
- Once generated, virtual tables can be customized from any solution, adding views and forms.

# Metadata driven

Native to virtual table relation

- Business Central data synchronization to native tables, can be used for master data. Foreign key relation use synchronized columns
- Using native table 'Account', field 'Account No' has to be added to sync
- Relation created from Account to Sales Order, using new native to virtual table capabilities
- Account form is customized to show Sales Orders

```

    graph LR
      subgraph Dataverse
        A[Account]

## Business Central data synchronization key principles

- Mapping**  
Matching metadata for integration
- Coupling**  
Linking 'identical' records being integrated
- Synchronization**  
Keeping data up-to-date
- Conflict resolution**  
Handling synchronization issues

https://events1.social27.com/msdyn365bclaunchevent2021w1/agenda/player/95776

## Native to virtual table relations

- Create a relation using custom key and attribute mappings
- The new relation can be created using *'Business Central Table Relation'* table

Native to virtual table relations

The slide features a man in a dark suit and glasses standing behind a laptop, presenting a slide with the title "Native to virtual table relations". The background of the slide is dark blue with a subtle pattern. The man is looking down at the laptop screen.

## Exporting and Import solutions containing virtual tables

- Export
  - Add customized native tables
  - Add generated virtual tables
  - Include customized Views and Forms
- Import
  - Install Business Central Virtual table solution from AppSource
  - Setup connection to Business Central
  - Import the solution
  - Virtual tables are autogenerated on import

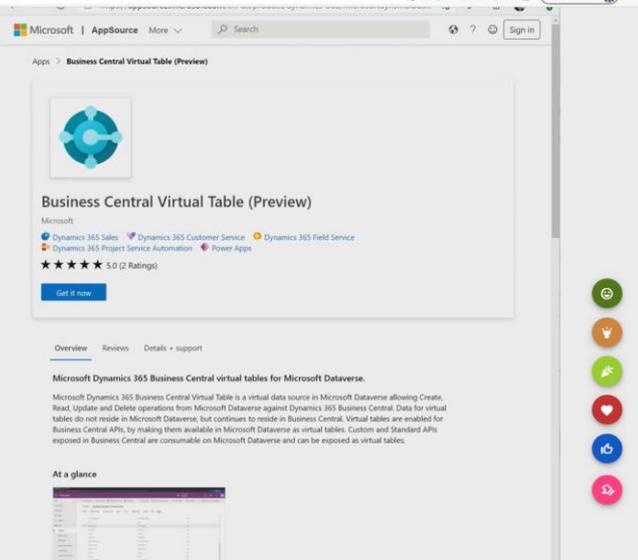

The screenshot shows the Power Apps interface. On the left is a navigation pane with options like Home, Learn, Apps, Create, Data, Flows, Chatbots, AI Builder, and Solutions. The main area displays a list of solutions under 'ISVSolution'. The table below shows the details of these virtual tables:

Display name	Name	Type
Account	account	Table
Item	dyn365bc_item_v2_0	Table
Sales Order	dyn365bc_salesorder	Table
Sales Order Line	dyn365bc_salesorderl	Table

## Getting the preview

- Install from AppSource
  - Choose Dataverse environment for installation
  - Available updates will show in Power Portal Admin Center

The screenshot shows the AppSource page for the 'Business Central Virtual Table (Preview)' solution. The page includes a Microsoft logo, the solution name, and a 'Get it now' button. Below the button, there are tabs for Overview, Reviews, and Details + support. The Overview section contains a detailed description of the solution and its capabilities.

**Microsoft Dynamics 365 Business Central virtual tables for Microsoft Dataverse.**

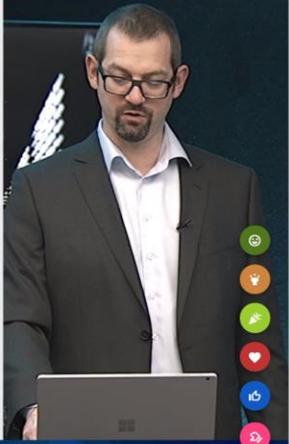

Microsoft Dynamics 365 Business Central Virtual Table is a virtual data source in Microsoft Dataverse allowing Create, Read, Update and Delete operations from Microsoft Dataverse against Dynamics 365 Business Central. Data for virtual tables do not reside in Microsoft Dataverse, but continues to reside in Business Central. Virtual tables are enabled for Business Central APIs, by making them available in Microsoft Dataverse as virtual tables. Custom and Standard APIs exposed in Business Central are consumable on Microsoft Dataverse and can be exposed as virtual tables.

**At a glance**

https://events1.social27.com/msdyn365bclaunchevent2021w1/agenda/player/95776

## Summary

- Business Central Virtual tables is a virtual data provider, connecting to Business Central APIs, providing create, read, update and delete
- Virtual tables are generated at runtime
- Custom APIs can be consumed and then exposed as virtual tables
- Company defaulting, on environment level and overridden at user level
- Relations between virtual and native tables. Foreign keys can be synchronized – master data
- Importing solutions containing virtual tables will generate virtual tables
- Available from AppSource in preview

https://events1.social27.com/msdyn365bclaunchevent2021w1/agenda/player/95776
